

WORK LOGS:

Date	Task Completed	Hours Spent
25- Oct- 2025	Integrated notification system with backend routes for incidents and volunteers. Configured Expo push notifications for real-time alerts when incidents are approved, assigned, or completed.	2 Hours
27-Oct-2025	Implemented read/unread notification logic, allowing users to mark notifications as read after viewing. Improved UI design of notification screen	4 Hours
29-Oct-2025	Added “Open in Maps” functionality inside the IncidentCard — when the user taps on the location, it opens Google Maps.	1.5 Hours
3-Nov-2025	Enhanced the Coordinator Dashboard to filter and display incidents by status (Pending, Approved, Assigned, In Progress, Resolved, Completed). Improved filter bar UI for better navigation.	5 Hours
4-Nov-2025	Continue working on coordinator dashboard. Added backend API integration and ensured successful data updates.	2 Hour

5-Nov-2025	Added Volunteer-side actions allowing volunteers to accept or decline assigned incidents. Set up notification triggers to instantly inform coordinators of volunteer responses.	2 Hours
06-Nov-2025	Improved the Incident Details Screen layout and extended “Open in Maps” support here as well. Created VolunteerCompletedScreen to display all incidents that volunteers have completed. Integrated it with backend.	4 Hours
7-Nov-2025	Merged PR #45 (Nearby Incidents + Improved UI) into my branch 43-harleen-notification-setup. Verified merge success, fixed minor UI inconsistencies, and re-tested notification flow.	2 Hours

DESCRIPTION OF WORK DONE:

Week 1(25 Oct – 31 Oct 2025):

This week, my main focus was on setting up the notification system and making communication between the users and the backend smoother.

I worked on integrating the notification feature with the backend routes for both incidents and volunteers, so users can now get real-time alerts through Expo push notifications whenever an incident is approved, assigned, or completed.

To make the experience more interactive, I also implemented the read/unread logic so users can

easily track which notifications they've already seen. Along with that, I redesigned the notification screen UI to make it cleaner, more organized, and easier to navigate. Later in the week, I added the "Open in Maps" feature to the "IncidentCard.tsx" file. This allows users to tap on a location and instantly open Google Maps to view where the incident happened — making the app more practical and user-friendly.

Week 2 (1 Nov – 7 Nov 2025):

In this week, I mainly focused on enhancing the Coordinator Dashboard and building out more advanced features for both coordinators and volunteers.

I improved the dashboard by adding status-based filters so coordinators can easily view incidents by their progress (Pending, Approved, Assigned, In Progress, Resolved, or Completed). I also connected it with the backend APIs to make sure all the status updates and dispatch actions work properly in real time.

On the volunteer side, I added functionality for them to accept or decline assigned incidents, which automatically triggers notifications to inform coordinators of their responses.

I also enhanced the Incident Details Screen by extending the "Open in Maps" support here as well, allowing users to check the exact location from multiple screens in the app.

Another key part of this week was creating the VolunteerCompletedScreen, which shows all the incidents that a volunteer has completed. I linked it with the backend to ensure the data loads correctly.

Finally, I merged my teammate Dilpreet's PR #45 (Nearby Incidents + Improved UI) into my branch 43-harleen-notification-setup, resolved some UI conflicts, and re-tested everything — including notifications and incident management — to make sure everything worked seamlessly together.

Git Hub Repo Branch: 43-harleen-notification-setup
